

una

Real-time Interaction Made Easy

What is Una?

Una is a free and open source Javascript library that allows developers to create interactive applications where multiple users can interact with large central displays in real-time using mobile devices.

Why use Una?

CROSS-DISPLAY INTERACTION

Una makes it easy for you to create interactive cross-display applications where users can interact with large displays using just their mobile devices.

NO INSTALLATION NECESSARY

Una is based entirely on HTML5. No special hardware nor the need to download more applications; just your mobile device and its browser will do.

EASY INTEGRATION

Una handles server transport logic for you and provides a convenient interface on the client side. This frees you to focus on what matters the most - your kick-ass application.
